

DIEHL CONTROLS ENVIRONMENTAL POLICY

ENVIRONMENTALLY CONSCIOUS THINKING AND ACTION

Our commitment to environmental protection

Environmentally conscious thinking and action are a central part of our corporate policy. Our aim is holistic, integrated environmental protection that is firmly embedded in our decision-making and working processes and is understood as an integral part of our corporate culture.

Responsibility for the strategic direction and implementation of environmental protection lies with the management, which is supported in this by an environmental management team. At the same time, we promote environmental awareness among our employees through transparent communication, training courses and regular briefings.

We do not regard environmental protection as a subsequent, costly measure in damage control; instead, we aim to assess and avoid the potential environmental impacts of new activities, processes and products at the earliest possible stage. Furthermore, Diehl Controls is committed to complying with all applicable laws and regulations.

With the successful implementation and certification of our environmental management system in accordance with DIN EN ISO 14001, we have laid the foundations for active environmental protection and sustainable practices. Through this system, we manage the continuous improvement of our environmental performance, with the aim of reducing our environmental impact and using resources as efficiently as possible.

We place particular emphasis on increasing the involvement of relevant stakeholders, whose perspectives and requirements we aim to systematically incorporate into our environmental goals and measures. We communicate the progress made and key performance indicators transparently in the Diehl Group's annual sustainability report.

Our guidelines

Climate protection and CO₂-neutrality

Protecting the climate and the environment is a key component of our corporate responsibility. We are actively committed to reducing greenhouse gas emissions and aim to operate on a CO₂-neutral basis (Scope 1 & 2) at all our production sites by 2050 at the latest.

We already systematically track our emissions and are working to reduce them by using energy-efficient technologies and by cutting indirect emissions from our energy consumption. Our aim is to switch entirely to electricity from renewable sources by 2045. In addition, we are raising awareness among our employees about the responsible use of energy.

Environmental and resource protection

By using environmentally friendly technologies and implementing targeted measures, we are constantly working to reduce air emissions and improve air quality. At the same time, we manage water resources responsibly and reduce our consumption through efficient systems.

We protect biodiversity and natural habitats by ensuring that construction projects include the creation of ecological compensation areas and by avoiding interference with sensitive ecosystems.

Sustainable product design

A key objective is to reduce the environmental impact of our products throughout their entire life cycle. Our products are designed for high energy efficiency and thus help to minimize energy consumption during use.

We give preference to ecological raw materials and semi-finished products that are environmentally friendly and, where possible, sourced locally.

We limit the use of hazardous substances to an absolute minimum. Where possible, we replace them with more environmentally friendly alternatives.

Circular economy and waste prevention

Another key focus is on waste prevention and reduction. We strive for smart product design and optimized processes in order to support the circular economy and contribute to the conservation of natural resources.

With these guidelines, we are creating a sustainable future – together and responsibly.
